

BROADBAND NEXT PHASE

Below is an update on the next phase of the broadband project. We are reaching out to homeowners whose addresses are included in the current list of homes scheduled to be connected to the broadband network. The next step will be the installation of the necessary equipment at each home, free of charge. This equipment will prepare your home for broadband service. If you received a door hanger notice, please call us back at your earliest convenience. THANK YOU!

**Congratulations!
You're on the list!**

We'd like to help you get connected to the brand new Bishop Paiute Tribe Fiber to the Home Project. Once we've scheduled an installation time, here are the next steps the we'll take.

- 1. Fiber drop to your property**
An underground fiber optic line is installed from the main network to your home or business
- 2. Installation of the ONT (Fiber Jack)**
A small device called an Optical Network Terminal (ONT) is mounted discreetly to the outside of your home, and a data cable will be run to the inside where your modem will go. This allows a future internet signal to reach your space.
- 3. Fiber Splicing and Testing**
Trained technicians make sure everything is securely spliced and test the connection to ensure it's strong and reliable
- 4. You're Fiber-Ready**
Even if you're not signing up for internet service now, your home or business will be ready to connect when you're ready.

To schedule your installation appointment please contact
Tammy Spoonhunter

Thank you for your cooperation

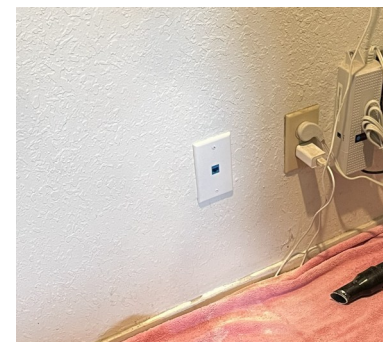

EXTERIOR INSTALLATION ON HOME

EXTERIOR INSTALLATION ON HOME

Home Installation Installer:

BRANDON HAUG, will be installing necessary equipment at each home during this phase of the broadband project.

The pictures above show the exterior and interior equipment that will be installed as part of the home connection process.
